

01

Quest — AI Support Agent

Support cases → grounded AI
recommendations, written
straight back into Dynamics
365 / ServiceNow

BUSINESS VALUE

~30–60s case →
recommendation, 24/7 hands-
off

INDUSTRIES

Cloud Infra · ITSM ·
Enterprise Support

BUILD STATUS

MVP deployed · phased
hardening

PROBLEM

Engineers triage every case by hand — routing, root-cause hunting and fix research are slow, inconsistent, and repeat work already solved in past tickets.

OBJECTIVE

Route, diagnose and recommend a fix on every case in ~30–60s — grounded in real case history — so engineers act instead of investigate.

SOLUTION

A stateless orchestrator runs a Routing → Diagnosis → Recommendation → Mitigation pipeline on each case, posts one grounded note back to the case, and safely auto-remediates only low-risk, high-confidence issues — every decision audited.

SYSTEMS INTEGRATED

Dynamics 365

ServiceNow

Azure OpenAI

MCP Tools

FEATURES

- Event webhooks → dedupe → state machine
- Skill- & shift-aware team / engineer routing
- Similarity-grounded root-cause diagnosis (pgvector)
- Hot Fix + Ultimate Fix with allowlisted links
- Guarded auto-remediation: verify-then-revert + kill switch
- Dual engine (legacy | MCP) + full audit trail

USE CASES

- Kubernetes / Karpenter infra incidents auto-triaged
- Reopened cases get an escalated recommendation
- Manager SLA-risk dashboard for open tickets
- 👍 / 👎 feedback regenerates an improved answer
- Reusable MCP tools for Copilot Studio agents

BENEFITS

- ~30–60s case → recommendation, hands-off 24/7
- Grounded in real history — no hallucinated fixes
- Graceful degradation — no single point of failure
- Safety-first: suggests by default, acts only behind gates
- Full auditability of every AI decision

02

Delivery Roadmap

Four waves from grounded triage to manager-approved remediation

APPROACH

Ship value each wave; auto-fallback keeps prior waves safe

CADENCE

Incremental — flag-gated, instantly reversible

PRINCIPLE

AI proposes; it only acts behind confidence gates

PHASED ROLLOUT

Build Phases

Each phase lands on the same orchestrator so behavior never drifts — later waves layer capability onto a proven core.

Phase 1

Orchestration & Grounded Recommendations

Doing now:

Routing → Diagnosis → Recommendation pipeline; pgvector similarity; D365 note write-back; audit log

Next:

Harden dedupe + Redis state in production

Status: LIVE

Phase 2

MCP Engine & Tooling

Doing now:

reasoning / knowledge / dataverse MCP servers; dual-engine flag (legacy | mcp)

Next:

Expose tools to Copilot Studio / Azure AI Foundry

Phase 3

Guarded Auto-Remediation

Doing now:

Safety gate + kill switch + verify-then-revert (simulated runbooks)

Next:

Real Dataverse / Graph / Defender runbook execution

Phase 4

Feedback Loop & Manager Ops

Doing now:

👍/👎 regeneration; outcome-based KB ranking; SLA-risk dashboard

Next:

Power Automate approve-and-execute workflow
